INTRODUCTION

The purpose of this document is to provide a comprehensive overview of the project's objectives, scope, and deliverables. This document serves as a guide for all stakeholders involved in the project, ensuring that everyone is aligned on the goals and expectations. The project aims to develop a new software application that will streamline the workflow and improve efficiency. The scope of the project includes the design, development, testing, and deployment of the application. The deliverables include the source code, user manuals, and a final report. The project is expected to be completed within a timeline of six months. The budget for the project is estimated to be \$100,000. The project manager is responsible for overseeing the project and ensuring that it is completed on time and within budget. The project team consists of a project manager, a software developer, a quality assurance tester, and a user acceptance tester. The project will be managed using a agile methodology. The project will be divided into sprints, each lasting two weeks. The project will be reviewed at the end of each sprint to ensure that the team is on track and to make any necessary adjustments. The project will be completed by the end of the sixth month. The final report will provide a detailed summary of the project's progress, challenges, and lessons learned. The project is expected to have a positive impact on the organization's productivity and efficiency.

Figure 1: The Role of the Teacher

The teacher is the central figure in the classroom. They are responsible for creating a safe and supportive learning environment. They are also responsible for assessing student learning and providing feedback. The teacher's role is to facilitate learning and to help students develop the skills and knowledge they need to succeed in the 21st century.

Figure 2: The process of the implementation of the project

The process of the implementation of the project is shown in Figure 2. The process is divided into three main phases: Planning, Implementation, and Evaluation. The Planning phase includes the following steps: 1. Define the project goals and objectives, 2. Identify the stakeholders, 3. Develop a project charter, 4. Create a project management plan, 5. Obtain approval for the project. The Implementation phase includes the following steps: 6. Execute the project plan, 7. Monitor and control the project, 8. Report project progress, 9. Manage project risks, 10. Communicate project information. The Evaluation phase includes the following steps: 11. Evaluate project performance, 12. Document project lessons learned, 13. Close the project. The process is iterative, and the steps are not always linear. The process is also flexible, and the steps can be adjusted as needed. The process is also transparent, and the steps are clearly defined. The process is also collaborative, and the steps are shared with all stakeholders. The process is also dynamic, and the steps are updated as needed. The process is also flexible, and the steps can be adjusted as needed. The process is also transparent, and the steps are clearly defined. The process is also collaborative, and the steps are shared with all stakeholders. The process is also dynamic, and the steps are updated as needed.

1. **Методика проведения исследования.** Исследование проводилось на базе кафедры психологии и педагогической психологии факультета психологии и педагогического образования Пензенского государственного университета. В исследовании участвовали студенты 1-4 курсов факультета психологии и педагогического образования Пензенского государственного университета. Всего в исследовании участвовало 120 человек. Исследование проводилось в 2019 году.

CONCLUSION

Our research has shown that the proposed system can effectively detect and classify anomalies in network traffic. The results of the experiments demonstrate that the system is capable of identifying a wide range of attack patterns, including those that are not covered by traditional signature-based detection methods. The system's performance is robust across different network environments and traffic volumes, indicating its potential for widespread deployment. The findings of this study suggest that the proposed system can be a valuable tool for network security professionals, providing an additional layer of defense against cyber threats. Further research is needed to optimize the system's performance and to explore its application in other network security contexts.
