

INVENTORY MANAGEMENT SYSTEM FOR WHOLESALE DISTRIBUTORS

A Practical Implementation Blueprint for Automated Stock Alerts and Reorder Notifications

What's Inside

1. Overview

2. Getting Started

3. Feature Reference

4. Setup & Configuration

5. FAQ & Troubleshooting

6. Support & Next Steps

Overview

This is an implementation blueprint, not installed software: a method for wholesale distributors to automate stock-level monitoring and reorder alerts, using the inventory or ERP data export you already have, combined with a workflow-automation tool and an AI summary step.

The real problem: many wholesale distributors still check stock levels manually or rely on someone remembering to look, which means stockouts and late reorders get caught after they already cost a sale.

This blueprint sets up a scheduled read of your existing inventory data, a simple reorder-point rule per product line, and a plain-language daily summary of what needs attention - instead of a dashboard nobody has time to check.

What this is not: not a replacement for your ERP or inventory system, not a hosted platform, and not an automatic purchasing tool - it flags what needs a decision, a real person still makes the reorder call.

Getting Started

Step 1 - Confirm your inventory/ERP system can export current stock levels on a schedule (most systems already support a CSV export or API).

Step 2 - Pick your highest-value or fastest-moving product lines to start with, not your entire catalog.

Step 3 - Set a reorder-point threshold for each of those lines, using your own past sales velocity as the guide.

Step 4 - Set up a scheduled workflow (n8n or Zapier) that reads the stock export and flags anything below its threshold.

Step 5 - Generate a short daily summary of flagged items and send it to whoever makes reorder decisions.

Step 6 - Expand to the rest of your catalog only once the first set of thresholds is proven accurate for a full ordering cycle.

Feature Reference

Four real building blocks, using tools and data you already have.

1. Stock Data Collector - a scheduled read of your existing inventory export, no new system required.
 2. Reorder-Point Rules - a per-product-line threshold based on your own real sales velocity, not a generic guess.
 3. Daily Flag Summary - a short, plain-language list of what's below threshold today, sent to the person who actually makes reorder decisions.
 4. Trend Note - an optional AI-generated note flagging a product line trending toward its threshold faster than usual, so a reorder decision can be made ahead of the actual shortfall.
-

Setup & Configuration

What you need: your existing inventory/ERP export or API access, a workflow-automation account, and an AI API key for the summary step.

A minimal first workflow: scheduled pull of current stock levels, compare against your set thresholds, summarize anything flagged, send to your reorder decision-maker.

Security note: this workflow only needs read access to inventory data - it should never have write or purchasing authority.

Start with your top 10-20 product lines by revenue before expanding further.

FAQ & Troubleshooting

Does this replace my ERP system? No. It reads from it and adds a simple, attention-directing layer on top.

Does it place orders automatically? No. It flags what needs a decision - a real person always makes the actual reorder call.

What if my thresholds are wrong at first? Expect to adjust them after the first cycle using what actually happened - this is normal and part of getting it right.

Is this installed software? No. It is a workflow you set up using your existing data and tools you choose and control.

Support & Next Steps

Start with your highest-revenue product lines this week, not your full catalog.

This blueprint does not include ERP software, inventory systems, or a support team from OpenClaw - every tool and data source referenced is one you already have or choose yourself.

Success here means catching stock shortfalls before they cost a sale, not a certification this document does not and cannot issue.
